

DIVISION OF PROPERTY VALUATION  
KANSAS 2024 REAL ESTATE  
FINAL RATIO STUDY REPORT

*BOB KENT, DEPUTY DIRECTOR*

## Introduction

The Kansas real estate ratio study is a statistical performance evaluation tool that can be used to make inferences about the relative level and uniformity of appraisals made for ad valorem purposes (K.S.A. 1995 Supp. 79-1485). The timeframe for this study is January 1, 2024, through December 31, 2024 [K.S.A. 1995 Supp. 79-1486(j)]. In a ratio study, property value estimates developed by the county appraiser are compared to fair market value indicators, represented by recent qualified sales. Although market value cannot be observed directly, sale prices obtained from an open and competitive market can often serve as a sign of market value. To produce a sales ratio, the county appraised value of a property is divided by its recent sale price. Typically, the county appraiser will update the value of property each year, as of January 1. These value estimates will be compared to sales that occur throughout the calendar year. The ratio study employs a sample of validated sales from each county to provide an overall measurement of mass appraisal performance, but it may not be relied on for an individual appraisal review for a selected property. See *Panhandle Eastern Pipeline Co. v. Dwyer*, 207 Kan. 417, 423, 485 P.2d 149 (1971).

The timeframe for this study is January 1, 2024, through December 31, 2024 [K.S.A. 1995 Supp. 79-1486(j)]. However, in some counties the real estate market activity was very limited, and the number of valid commercial/industrial sales gathered during the calendar year was insufficient to prepare meaningful performance statistics. Prior year supplemental sales are not considered if there are insufficient sales. If less than three valid sales are available in a subclass sample, a confidence interval will not be calculated, and ratio study performance measures will not be used to determine statistical compliance (K.S.A. 1995 Supp. 79-1488).

The sales ratio study is the most widely used tool for measuring mass appraisal accuracy. However, to fully evaluate appraisal performance within a county, many technical requirements, procedural tasks, and statutory functions must also be reviewed and examined. When relatively few sales are available for a reliable statistical analysis, an independent audit of county appraisal procedures can often provide a more reliable indication of overall performance.

The individual county statistical measures should be interpreted with caution if there is limited sales activity within a property subclass.

Final statistical measures for level and uniformity were adjusted for time in 20 counties and the final validation review was completed for 20 counties as a result of appeal requests.

## Executive Summary

The statistics presented in this Final report include the standard industry measures used to evaluate mass-appraisal performance. These consist of the overall level of appraisal, measured by the median ratio, the degree of appraisal uniformity, measured by the Coefficient of Dispersion (COD), and the relative degree of equity between the appraisal of high-dollar property compared to low-dollar property, (within the same real estate subclass) measured by the Price-Related Differential (PRD). There has been considerable interest in and examination of the residential and commercial/industrial subclass performance measures over the past 30+ years. The Final ratio study provides details on these two subclasses of property. This report indicates that more than 97.5 percent of the residential value statewide and about 92.1 percent of the commercial/industrial property value in Kansas counties meets the standard for overall appraisal level (a median ratio confidence interval range that overlaps 90% to 110%). The measure for uniformity indicates that 99.9 percent of the residential and 96.6 percent of the commercial/industrial property value statewide meets the standard for overall equity (the low end of the COD confidence interval range be 20.0 or less).

## Summary Statistics

For the residential and commercial subclass, the summary data includes 95% confidence intervals calculated for the Median Ratio, COD and PRD. The statistics have been listed by county and presented in a spreadsheet type format. A report has been prepared for the following constitutional subclasses or subclass groups of real property:

- Residential (*includes apartments, mobile home parks, adult care facilities & condos*)
- Commercial / Industrial
- Vacant Lot
- Farm & Home Site (*agricultural land in use value with a residential home site*)
- All Agricultural (*land in use value with, or without farmstead improvements*)
- Agricultural Land Only (*land in use value only*)
- Total Market Value Subclasses (*no agricultural use value properties included*)

## Reported Performance Statistics

The **MEDIAN RATIO** is the middle ratio in a sorted array of sales ratios; 50% of the ratios lie above the median and 50% fall below it. A ratio is calculated by dividing the appraised value by the sale price of the property. The median ratio is the commonly used estimate of overall appraisal level because it is less influenced by extremely high or low ratios that may be found in the sample.

The **MEDIAN RATIO CONFIDENCE INTERVAL** provides a range estimate in which the true county median ratio is expected to fall. The confidence interval estimate is a more useful indicator of the actual level of appraisal for all properties in the county (population), both sold (those used in the ratio study sample), and unsold. The acceptable compliance range for the median ratio is 90.0 to 110.0 %. The selected confidence level is 95%. The ideal confidence interval range for a sample will overlap 100%. For sample sizes of 5 the level of confidence must be lowered to 90%. For a sample size of 4 or 3 the level of confidence is lowered to 85% and 80% respectively.

The **COEFFICIENT OF DISPERSION (COD)** is the most common measure of uniformity in sales ratio studies. It indicates how tight the ratios are clustered around the median ratio. A low COD is associated with good appraisal uniformity. The COD is a proportional measure found by taking the average of the absolute deviation of ratios about the median and dividing by the median ratio of the sample. The standard in Kansas requires the low end of the COD confidence interval range to be 20.0 or less for both the residential and commercial/industrial subclasses of property for a county to achieve statistical compliance. Although the ideal COD would be 0 (every property is appraised at the exact median ratio), this goal is not realistic in an imperfect real estate market. The COD seldom drops below 5.0 in most counties.

The **COD CONFIDENCE INTERVAL** provides a range estimate in which the true population COD is expected to lie with a 95% level of confidence. To achieve the standard for uniformity compliance the lower end of the confidence interval must reach a COD of 20.0 or less.

The **PRICE-RELATED DIFFERENTIAL (PRD)** is used to measure value-related equity (vertical equity) in a mass appraisal. Inequity problems are often referred to as regressivity or progressivity. The appraisal process is regressive if high-value properties are under-appraised relative to low-value properties. It is progressive if high-value properties are over-appraised relative to low-dollar properties. The PRD is found by taking the mean ratio of the sample and dividing by the value-weighted mean ratio. The standard calls for a PRD to fall between .98 and 1.03.

The **PRD CONFIDENCE INTERVAL** provides a range in which the true county PRD is expected to lie with a 95% level of confidence. A PRD above 1.03 suggests that the appraisal process may be regressive. A PRD below .98 suggests that the appraisal

process may be progressive. The ideal confidence interval will overlap a measure of 1.00. To achieve the minimum standard for statistical compliance, at least one tail of the 95% PRD confidence interval range must either overlap .98 or 1.03.

The **TOTAL NUMBER OF VALID SALES** is the sample size. The sample consists of verified arms-length transactions in which a well-informed seller and buyer transfer the ownership of property in an open and competitive market, acting without undue compulsion, as described in K.S.A. 503a. Only valid sales are used in the ratio study. The qualification screening and confirmation work is performed independently, by staff appraisers and research analysts with the Division of Property Valuation. In the 5 largest counties with sufficient sales activity, a random and representative sample of residential sales has been selected and verified by appraisers with the Division of Property Valuation (K.S.A. 1995 Supp. 79-1488). The sample size goals for these counties will range between 200 and 400 valid sales. For all other Kansas counties and all other real property subclasses, every real estate transfer questionnaire has been examined and screened. All valid sales have been included in the ratio study sample.

The **NUMBER OF TRIMMED SALES** accounts for ratio outliers found in the sample. These sales produce extremely high or low ratios that may be suspect or invalid sales; however, they are not typical for the county and can severely distort statistical uniformity measures. For some transactions, the sale data may be questionable or untrustworthy, but there is insufficient evidence to invalidate the sale. Therefore, these observations will remain in the sample. However, the statistical measurements for uniformity (COD, PRD, and Median) have been trimmed to remove extreme outlier ratios if they are identified. A mathematically based diagnostic algorithm is used to detect outlier ratios that will be trimmed from each subclass sample.

## Conclusions: 2024 Residential and Commercial/Industrial Subclasses

### Median Ratio

The median sales ratio confidence intervals suggest that 85 Kansas counties have achieved compliance with the required level of fair market value (a median ratio confidence interval overlapping a range of 90% to 110%) in the residential subclass. 37 counties lacked sufficient data in the commercial/industrial subclass to generate statistics. Excluding these 37 counties, 58 counties met the statistical standard in the commercial/industrial subclass for appraisal level.

### COD

The Coefficient of Dispersion confidence intervals suggest that 104 counties met the uniformity standard in the residential subclass, representing more than 99.9 percent of the residential property value statewide. Excluding the 37 counties that lack sufficient data, a total of 67 counties met the COD uniformity standard in the

commercial/industrial subclass. Those counties failing to meet the COD standards in the commercial/industrial subclass make up about 0.5 percent of the commercial/industrial property value statewide.

## **PRD**

The Price-Related Differential confidence interval measures indicate that 100 out of the 105 counties met the PRD price-related uniformity standard in the residential subclass. These counties represent more than 99.5 percent of the residential property value statewide. In the commercial/industrial property subclass, excluding the 37 counties without data, 65 counties met the PRD standard, accounting for about 88.0 percent of the total commercial/industrial property value statewide.

Confidence intervals have been calculated for the Residential and Commercial/Industrial subclasses only
